Author
Mark Latham is a writer, editor, and games designer from Staffordshire, UK. Formerly the editor of Games Workshop’s White Dwarf magazine, Mark has since become an author of speculative fiction, writing novels and short stories in the SF, fantasy, and horror genres. His first novel of Victorian science fiction, The Lazarus Gate, will be published in Autumn 2015 by Titan Books. Mark was responsible for several historical tabletop games, notably Legends of the Old West and Waterloo, and still turns his hand to games design when time permits.

    Draper’s World Xeno-Parasites
    Centauran Araknyds
    Hive-Beasts of Klaatu VI
    Bugs of the Galaxy

Infamous Infestations – A Timeline of Bug Hunts 46

STAR Industries and the Pan-System Marine Corps 51
    Remit & Jurisdiction
    Organization & Standard Operating Procedures
    Tactics
    Weapons & Equipment
    Vehicles & Spacecraft
INTRODUCTION

They said there were no monsters, but there are.

Since first reaching out to the stars, mankind has wondered about the vastness of the galaxy, and asked itself the only question that really mattered: “Are we alone?” In the late 23rd century, after colonizing most of the solar system and visiting worlds even farther afield, we received our answer. But what we were faced with was not an advanced intelligence, nor even primitive beasts to be subjugated to humanity’s manifest destiny, but something altogether more terrifying.

Bugs. The term was coined by a private security detail who first encountered a sentient alien species on Draper’s World, in the HD 40307 system, in AD 2239. The encounter was brief and violent, and only a handful of the detail escaped with their lives, along with only one of the 13 astro-geologists they were protecting. Half of the survivors died of a mysterious illness before reaching the Kepler Deep Space Research facility, and those that survived underwent further alarming transformations in secure quarantine. As a result, their attackers were identified as a highly aggressive Xeno-Parasite, capable of infecting human biology with previously unknown viral contaminants, and of implanting its eggs into a living human host. Though the word “bugs” stuck as a catch-all term for the weird and varied beasts of the galaxy, it certainly does not convey the full weight of the threat carried by these creatures.

Over the next 50 years, as humans left Earth in greater numbers to form work colonies in distant systems, dozens more bug species were discovered. Of these, only two presented a threat comparable to (or even greater than) the Xeno-Parasites. These were the Centauran Araknyds and the Hive-Beasts of Klaatu – both of which seemed capable of higher thought processes, and, alarmingly, deep space travel. Unlike the Xeno-Parasites, which managed to spread to disparate worlds by means of infected human hosts, the other creatures were able to exist in the cold void of space, and to travel to systems before attacking them in vast swarms. As contact with these species increased, and battles raged, system-wide incursions by these bugs became more frequent, undoubtedly targeting human colonies with malign intelligence.

As soon as the Earth-based government, the Pan-System Authority, reluctantly addressed the possibility of an intelligent extra-terrestrial threat, they set about finding a way to meet it. Interstellar defense was an area with
